In the Abstract:

5 Please add the following abstract on a separate page
following the claims:

--Abstract

10 The device management is performed by managing objects in
devices of a device management system in a mobile network
infrastructure. The system has a first server with a first
device management application using a first protocol, a
second server with a second device management application
using a second protocol, an interface between them and a
15 device with objects to be managed. The first management
application initiates a device management session with the
interface in order to manage the objects in the device. The
interface translates the objects to be managed into a form
understood by the second management application and invokes
management operations to be made by the second management
20 application. The first management application then performs
the management operations to the device.--
